OATH OF DECLARATION:

HORMONE REPLACEMENT THERAPY

Published scientific literature confirm that certain plant compounds used in our formulas produce progestational and estrogenic effects by putting mild plant estrogens or plant hormones back into the system, which reportedly help to offset menopause's estrogen deficit.

Our recommended diets contain estrogenic plant components that also may help stem hot flashes and other symptoms of menopause, by adding to estrogen levels in the body.

Some plant factors obtained through diet might also reduce the risk for cancer: by binding to and blocking estrogen receptors, thus diminishing the effects of incoming natural estrogen that other- wise might lead to tumor growth. (Tamoxifen, an estrogenlike compound and a treatment for breast cancer, is thought to work in this manner.)
